

TESLA

Tesla Thermal Team is responsible for the cabin and powertrain heating and cooling systems. You will design, test, and prototype mechanical components and systems for current and future Tesla vehicle and product programs. Your scope of work will be mechanical, however interdisciplinary in nature. You will be challenged to come up with creative solutions to novel design problems while balancing cost, mass, and manufacturing constraints. Additionally, you will work collaboratively with cross-functional partners and external vendors and suppliers.

Responsibilities

- Work closely with cross-functional teams to define product requirements and develop vehicle specific implementations.
- Develop designs in CAD for both detailed parts and master model assemblies, based on first principles and engineering analysis
- Hands-on prototyping, testing & troubleshooting
- Run validation tests and perform data analysis.
- Create 2D drawings appropriate for high-volume production and inspection methods.
- Conduct Design for Manufacturing (DFM) reviews with suppliers and support tooling bring up.
- Provide factory engineering support to help identify and resolve issues.
- Trial designs and incorporate feedback given from the New Product Integration team.

Requirements

- Pursuing BS/MS/PhD in Mechanical engineering or related field
- Focus areas: Solid mechanics, dynamics, materials, thermals, and fluids
- Strong fundamentals in mechanical engineering
- Proficiency in CAD tools, such as Catia, NX, Solidworks Pro/e, etc.
- Experience in drafting 2D drawings with GD&T.
- Ability to perform first-principles analysis to ensure a successful design (stress-strain, thermal, tolerance, cost and mass optimization, etc.)
